

OpsFortress MVP ERD v0.3 - High-Level Architecture

Updated for onboarding, global business identifiers, P0 architecture proof, evidence and audit trail

How to read this page

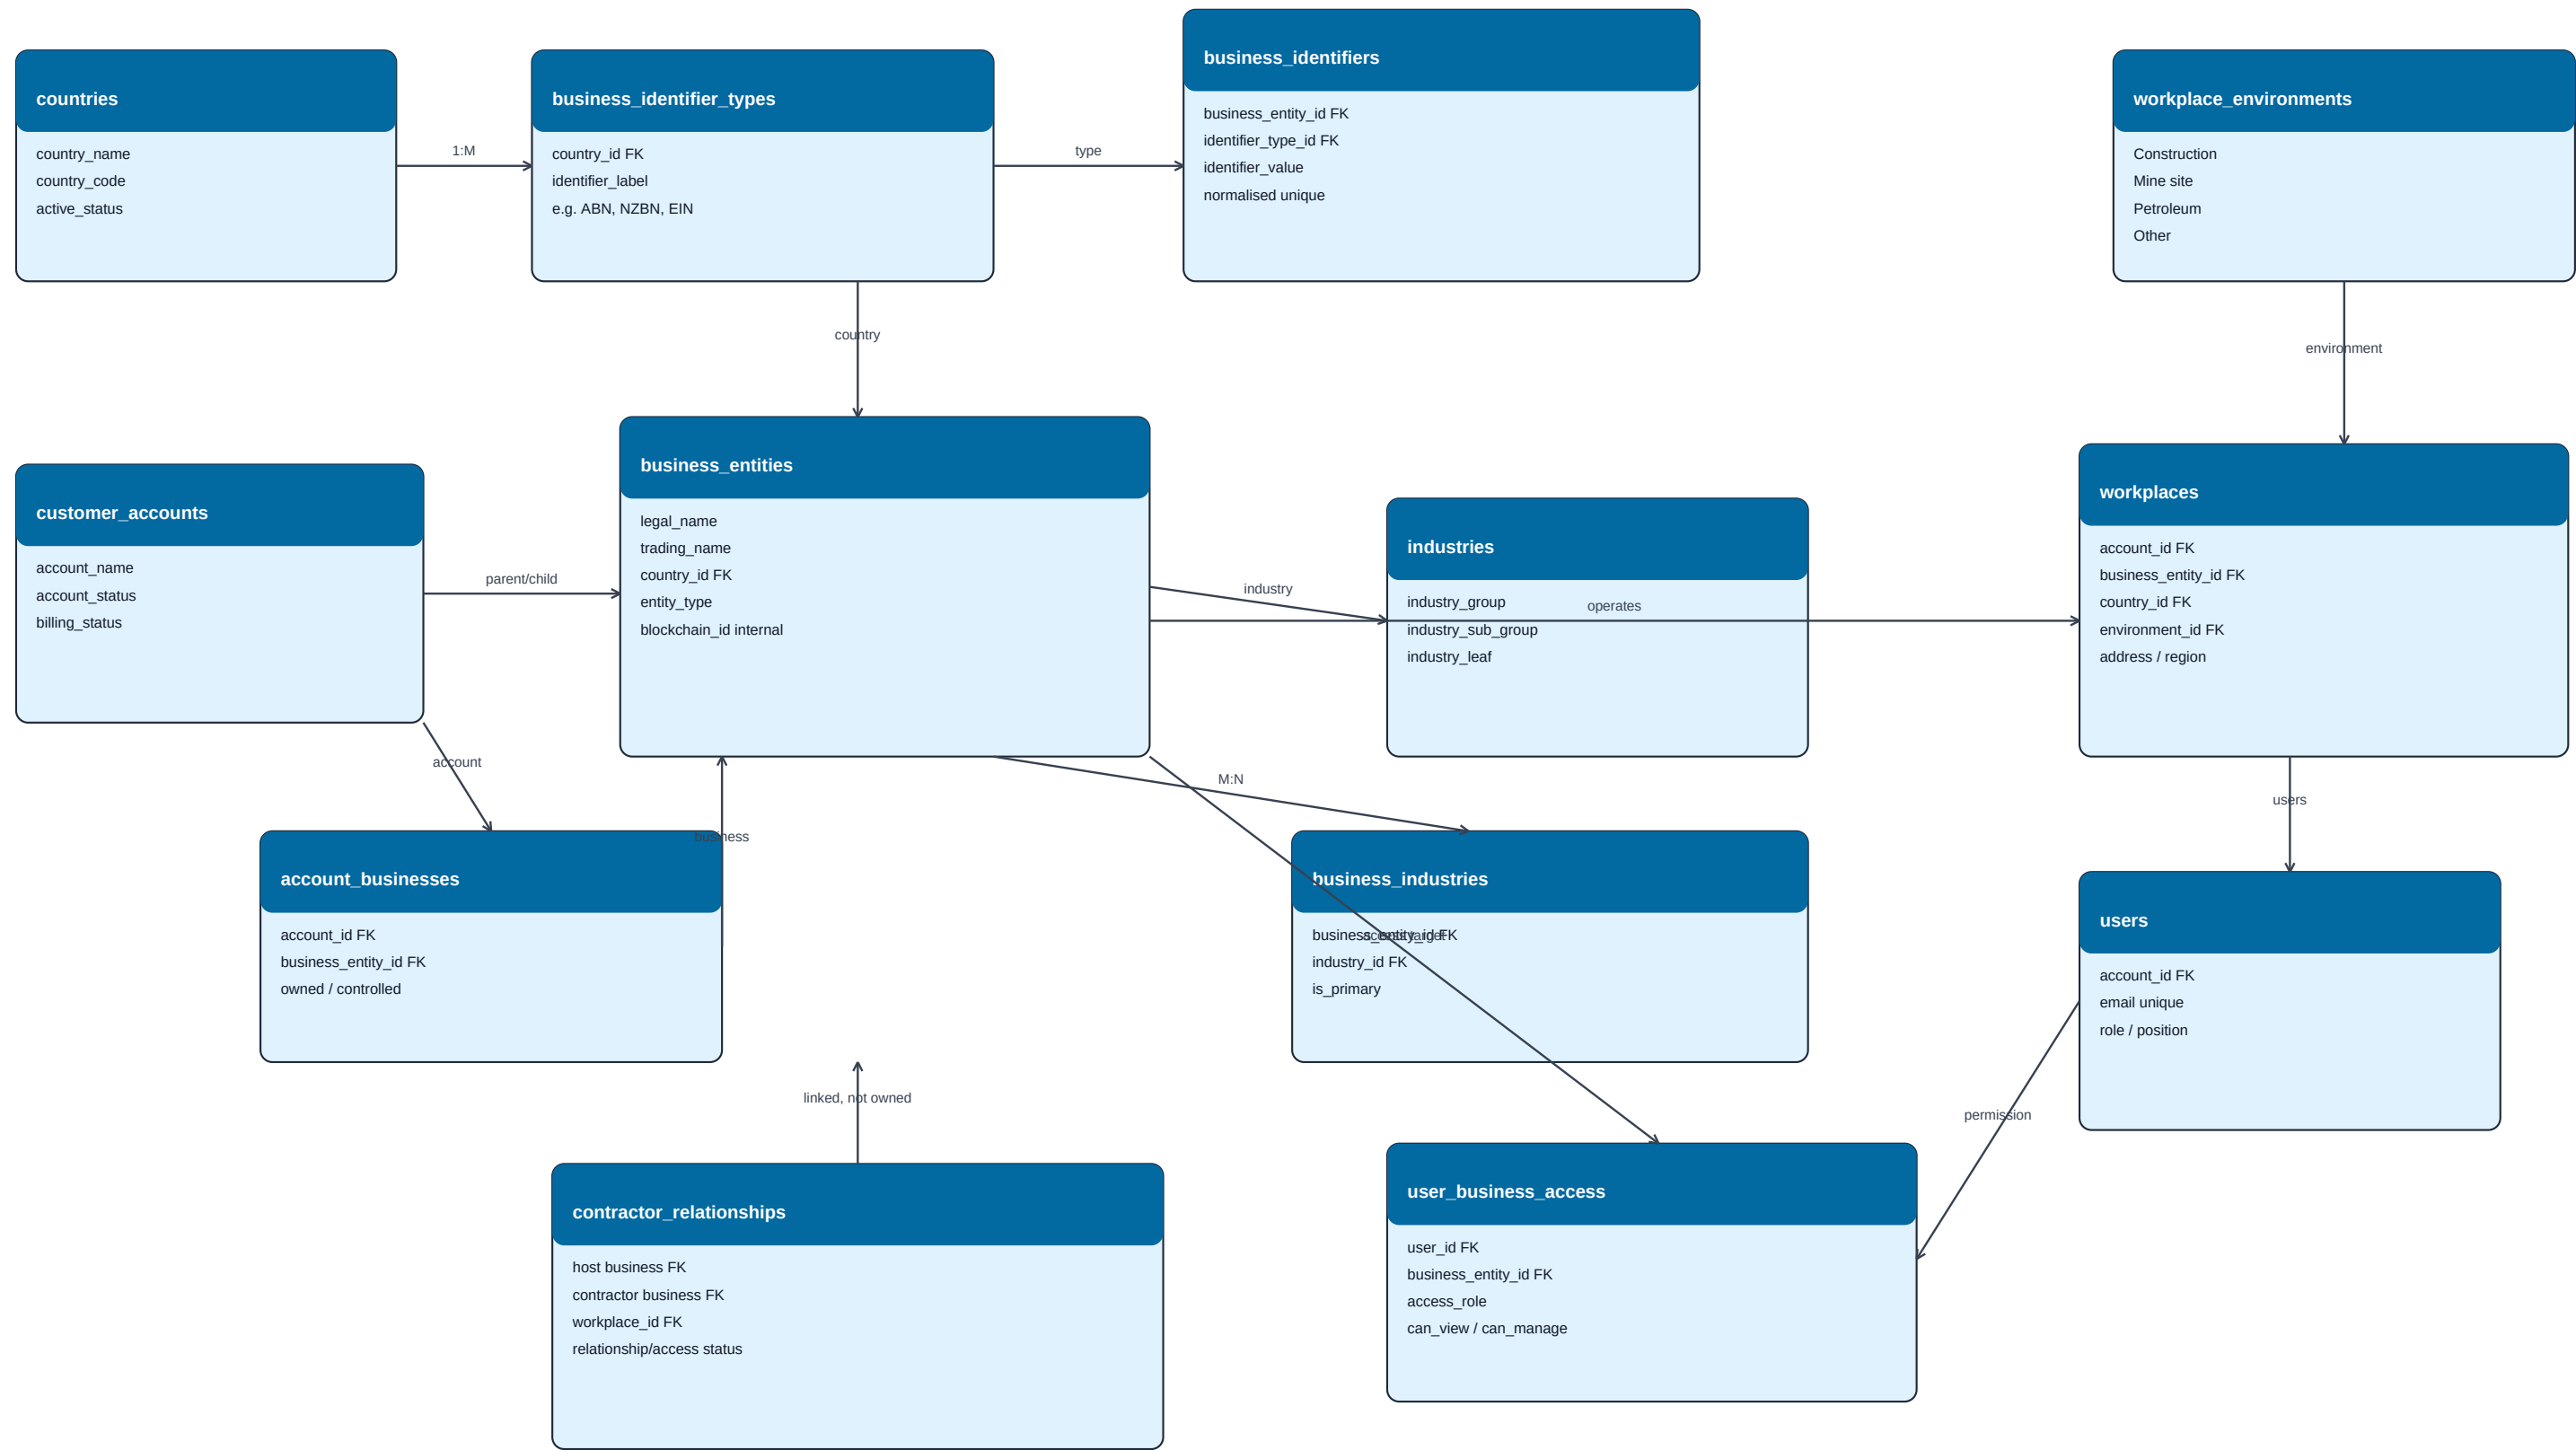

- P0 is an architecture proof, not only a simple UI demo.
- ERD is for understanding and alignment; Laravel migrations / SQL create the actual PostgreSQL tables.
- Onboarding creates account, legal business, business identifier, workplace and group admin. SWMS importer loads task content separately.

P1 Expansion - after P0 architecture is proven

posttask_questions + posttask_responses
training_questions + attempts + responses
full permit / asset / chemical / incident / dashboard modules
Keep P1 unless Kevin wants full four-component flow in first d

Core Platform / Client Onboarding ERD (P0)

Purpose: prove account, business, identifier, workplace, permission and contractor relationship logic

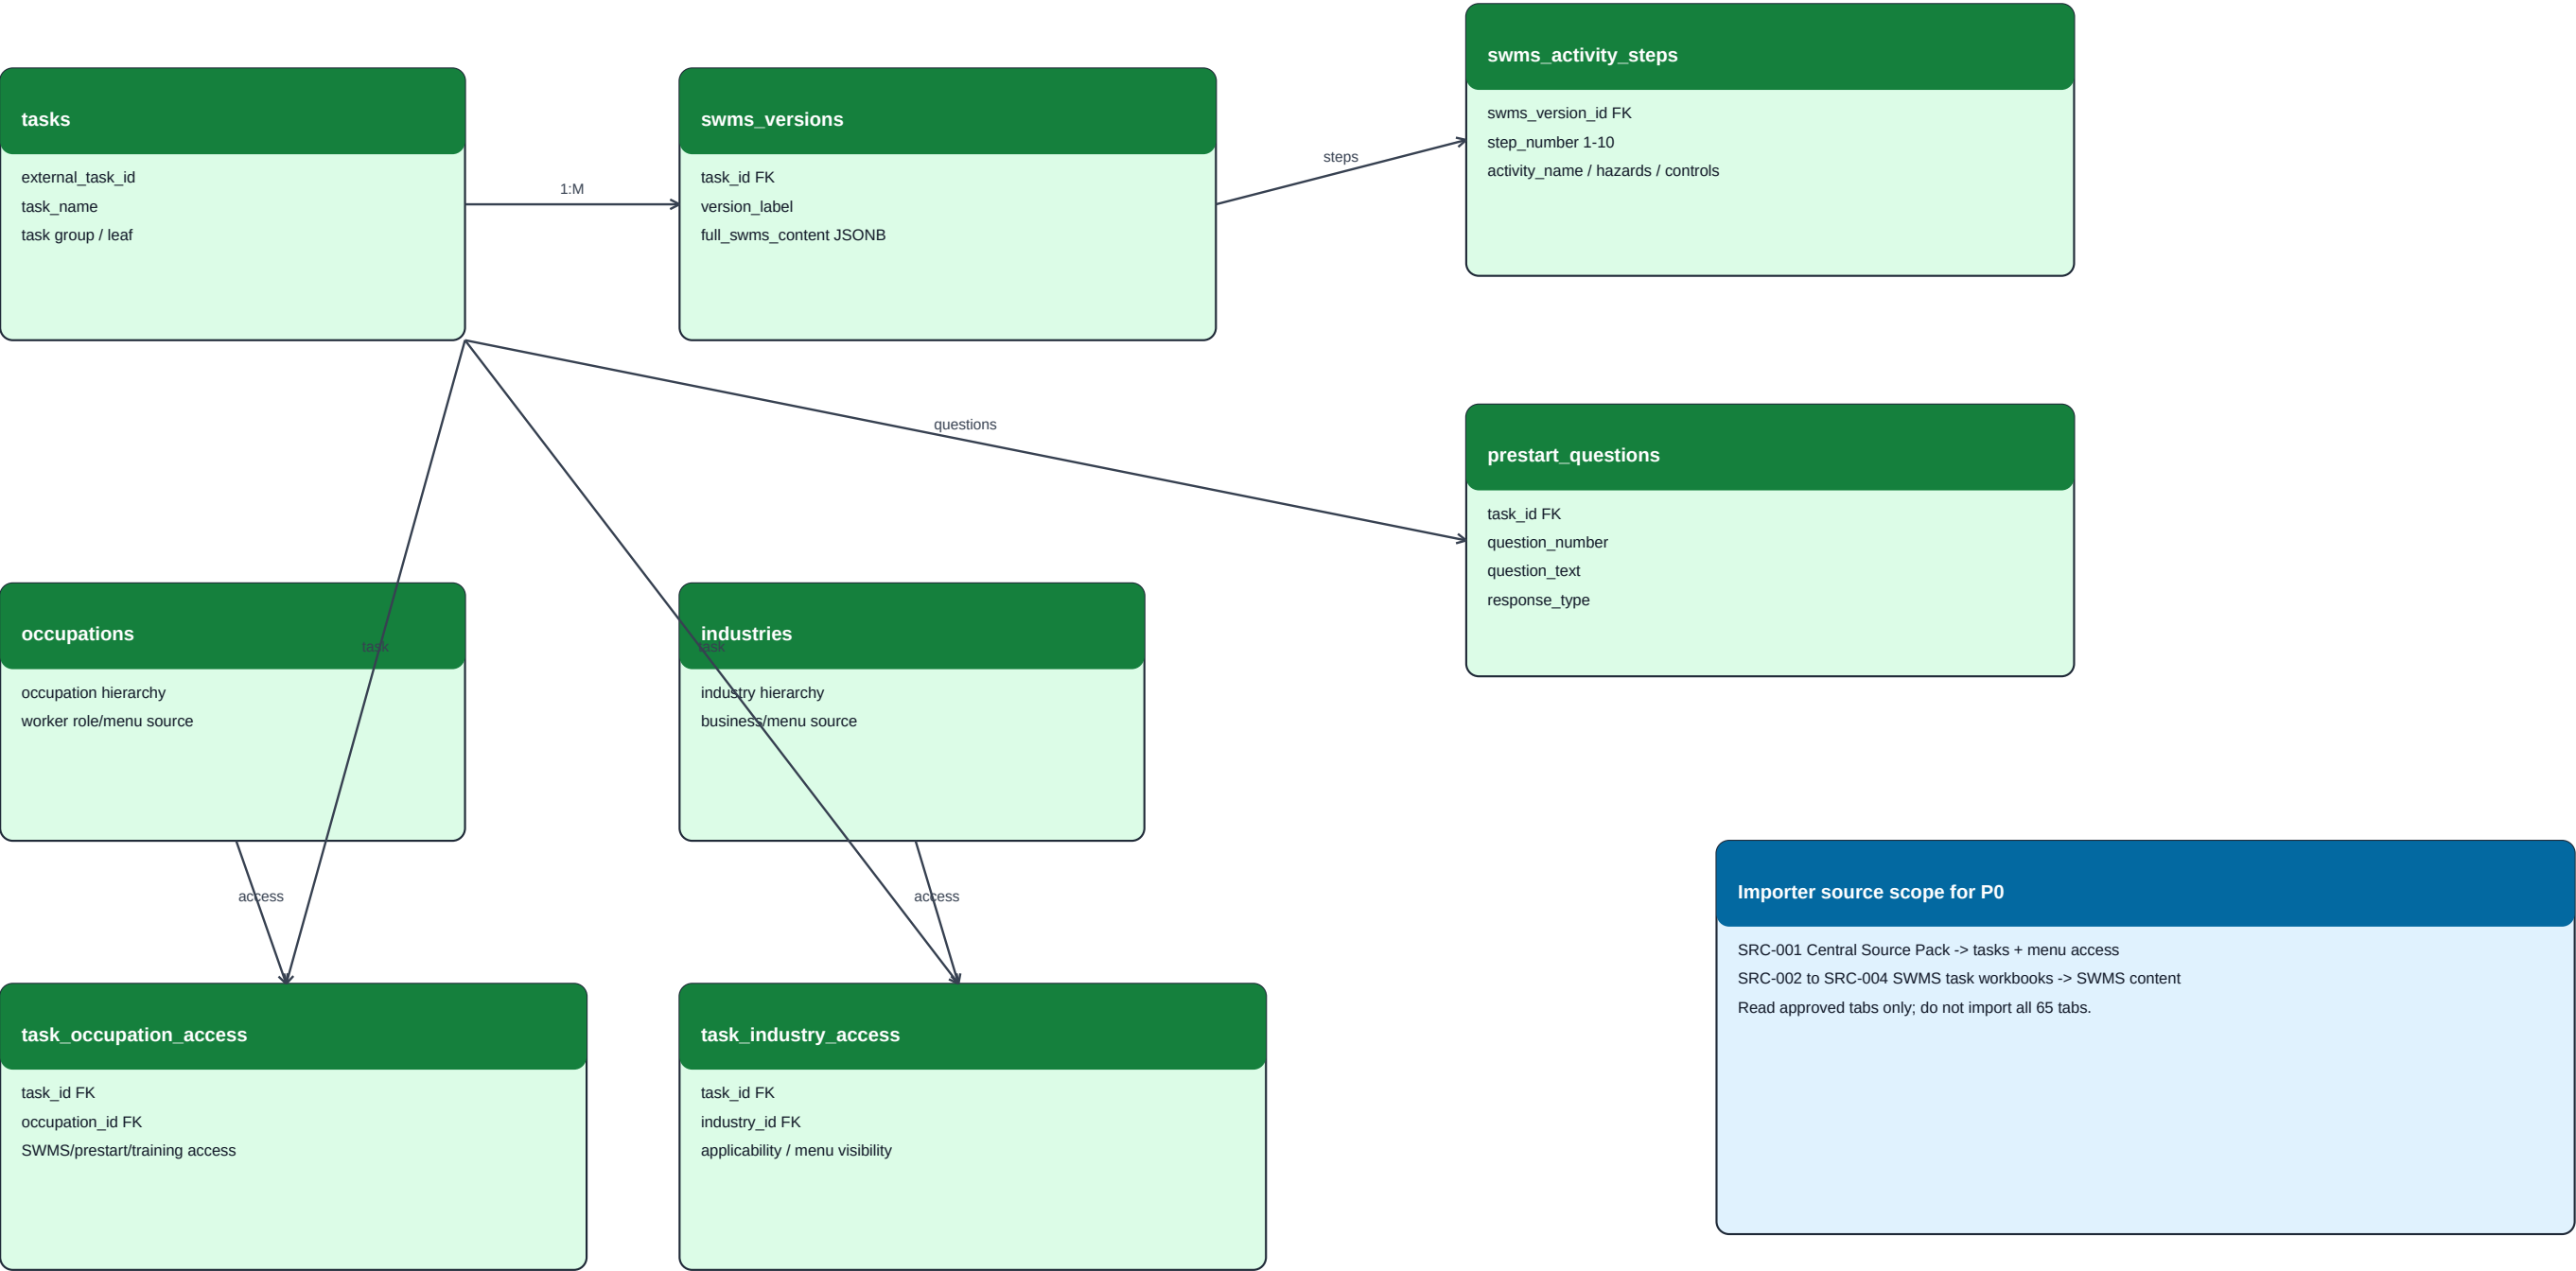

Key business rules confirmed by Kevin

- One paying account can manage multiple legal businesses through a parent/child structure.
- Each legal business remains separate; identifiers should not be duplicated.
- Contractors remain their own legal business and connect only through linked relationships.
- Global Business Identifiers turns ABN-only thinking into country-specific identifier types.

SWMS Content and Menu / Permission ERD (P0)

Purpose: import static WHS content and control task visibility by occupation / industry

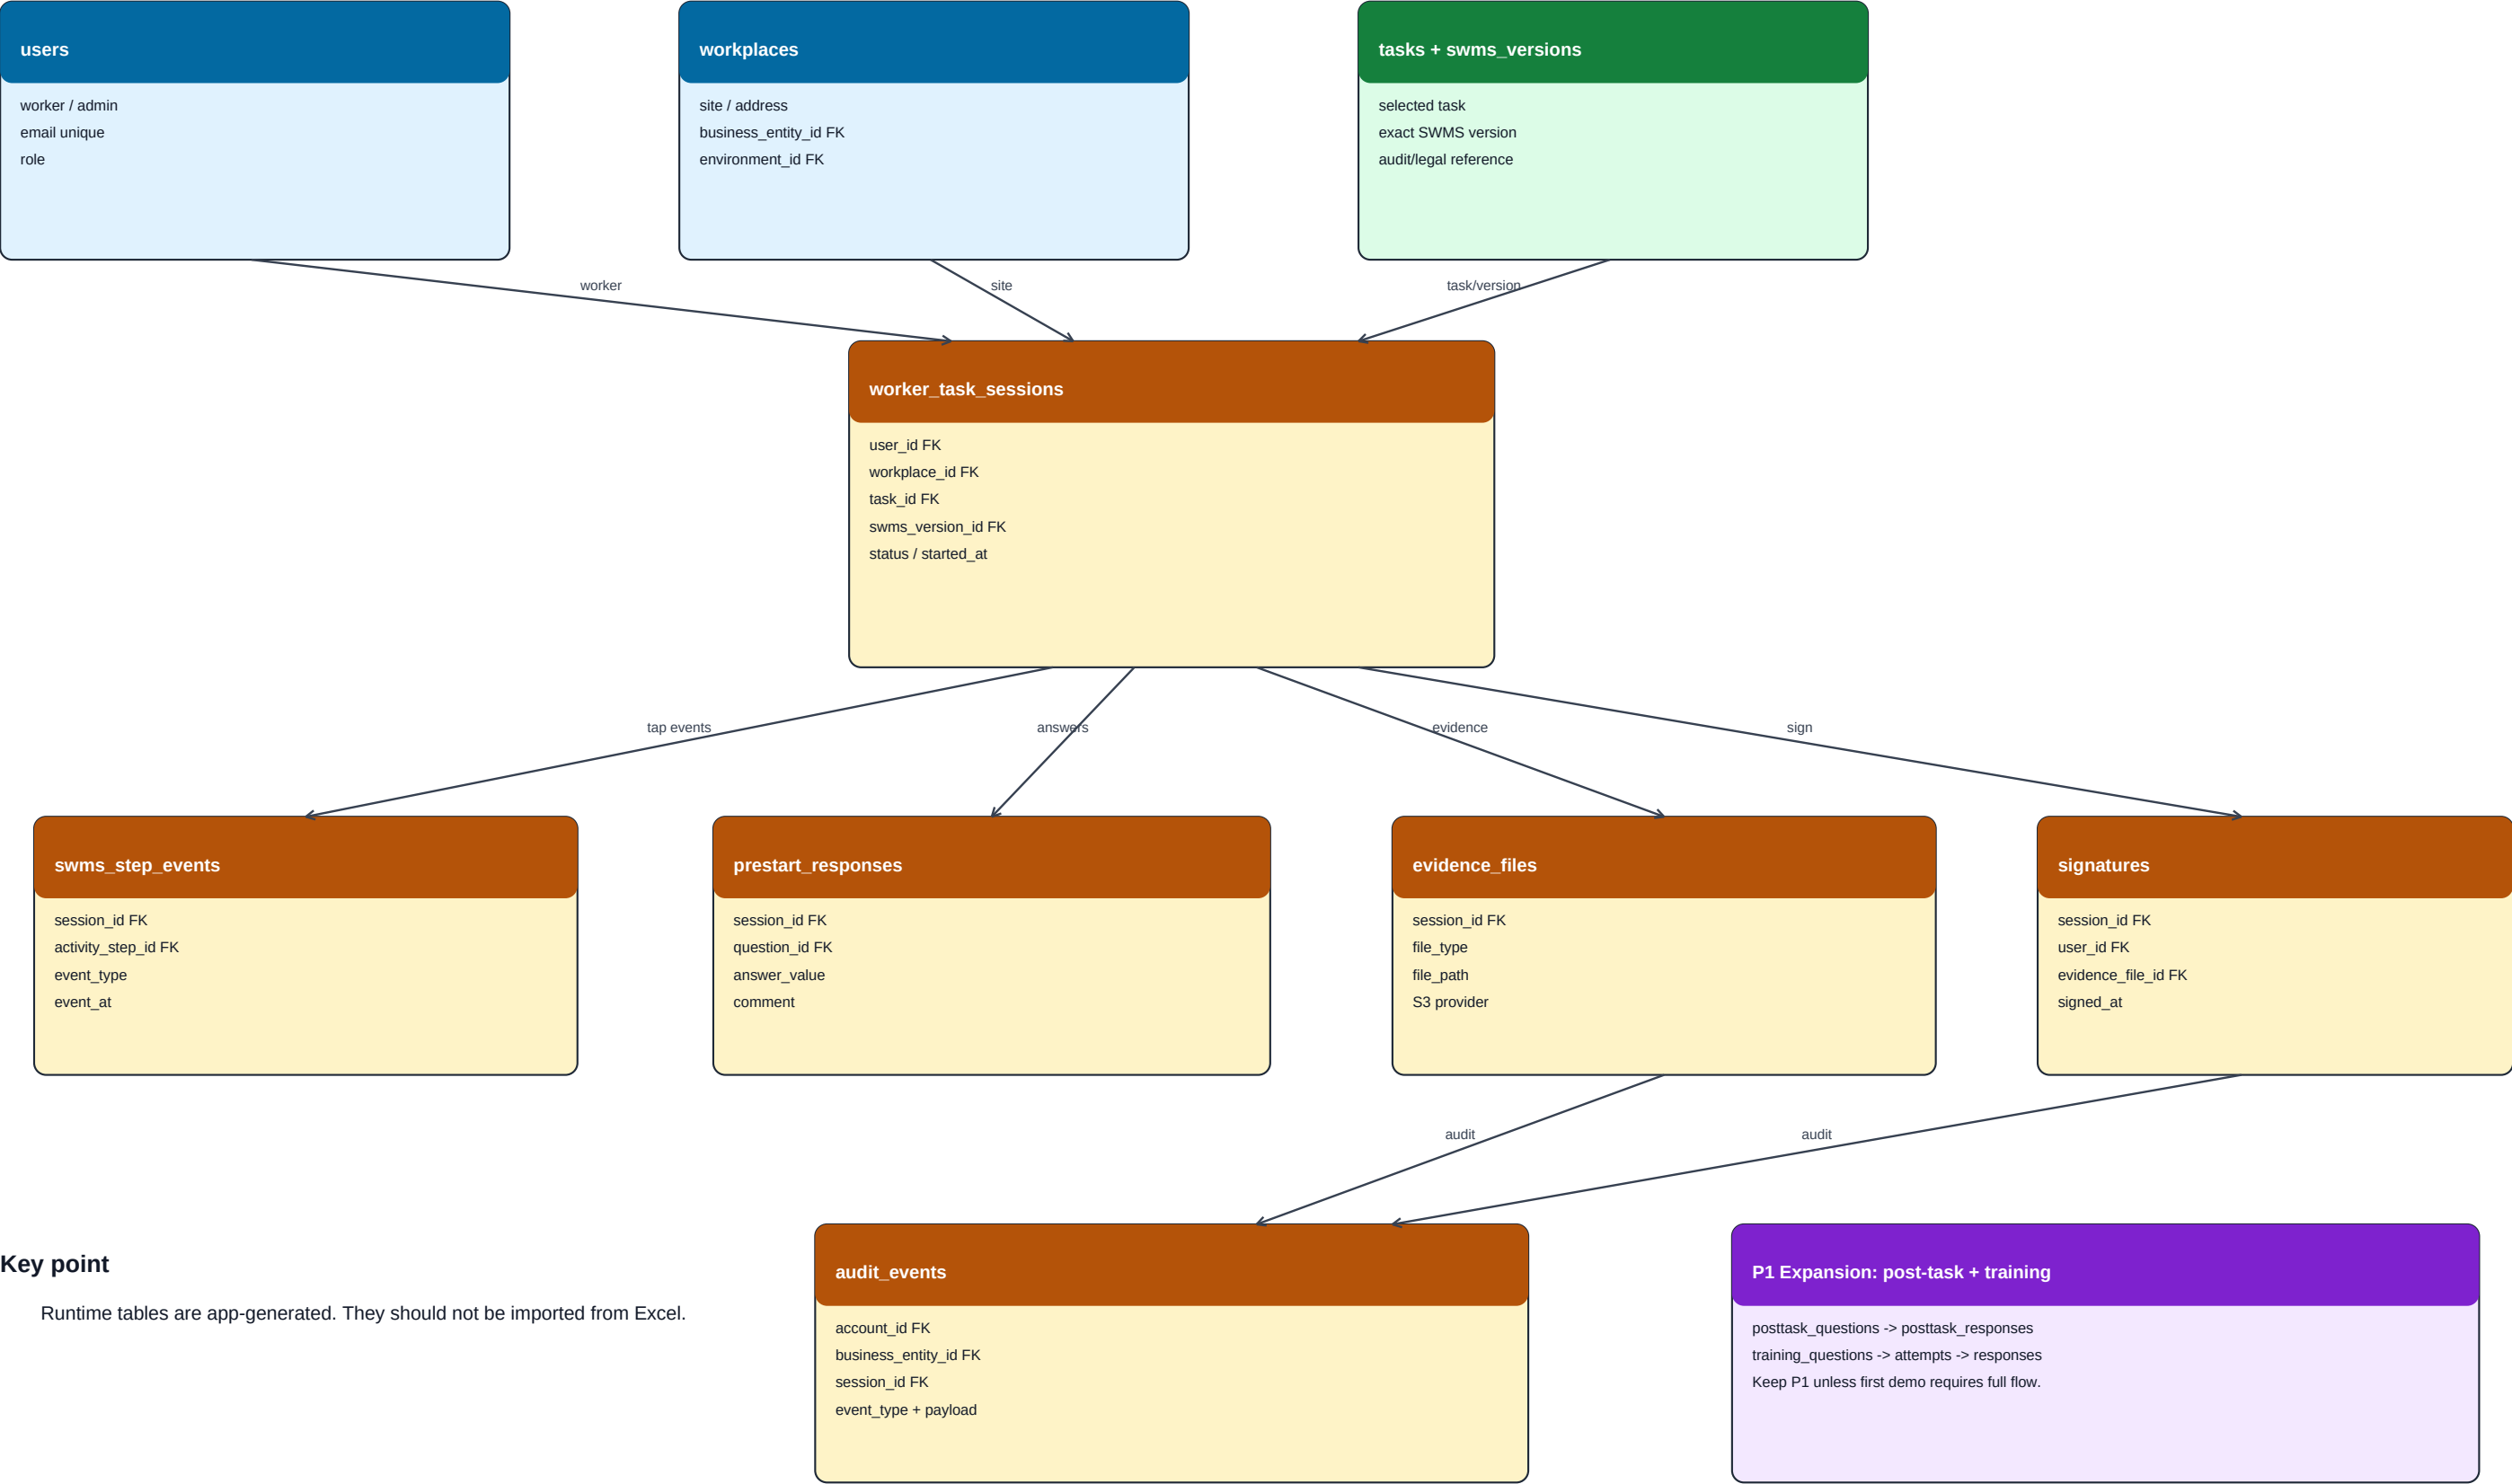

Key point

Static SWMS content is imported from Excel and kept separate from worker runtime records.

Worker Runtime, Evidence and Audit ERD (P0 + P1)

Purpose: prove worker action -> event record -> evidence -> audit trail

Key point

Runtime tables are app-generated. They should not be imported from Excel.
